

Right from the start of Electricity Market Deregulation a basic premise has been that Markets should be operated so that their operation results in benefits for the Consumers. This is a major challenge especially today. Another challenge is making the Power Grids Smarter. The European Grid in the era of Green Energy Transition (GET) should operate with security and maximum efficiency. The 16 annual international DEMSEE Events were organized in many a place across the Balkans and have helped in the dissemination of technical information and practices in South Eastern Europe as well as in the Networking between Power Engineers in the Region.

Participation includes Academia, Authorities, System and Grid Operators, Research institutions as well as interested freelance Engineers.
